

**MAWLANA BHASHANI SCIENCE AND TECHNOLOGY UNIVERSITY**

**Santosh,Tangail – 1902**

**Course Title : Computer Networks Lab**

**Lab Report Name : Introduction to Python**

**Lab Report No : 01**

**Submitted by,**

**Name: Afrin Zaman &**

**Mahfuza Talukdar**

**ID: IT-18008 & 18009**

**Session: 2017-18**

**Dept. of ICT, MBSTU**

**Submitted to,**

**NAZRUL ISLAM**

**Assistant Professor**

**Dept. of ICT, MBSTU**

## Theory:

Python is an easy to learn, powerful programming language. It has efficient high-level data structures and a simple but effective approach to object-oriented programming. Python's elegant syntax and dynamic typing, together with its interpreted nature, make it an ideal language for scripting and rapid application development in many areas on most platforms.

## Setup of Python Environment

STEP 1: Open Eclipse and setup a correct access to Internet (This is required only in RMIT network). In order to set up Manual Proxy follow the instructions (see also figure 1):

a. Go to **Windows > Preferences > General > Network Connections**.

b. Change Active Provider to Manual.

c. Input proxy details, including username/password if required.

- **Host:** proxy.rmit.edu.au
- **Port:** 8080
- **Username/password:** No required

d. Clear SOCKS proxy.

e. Restart Eclipse.

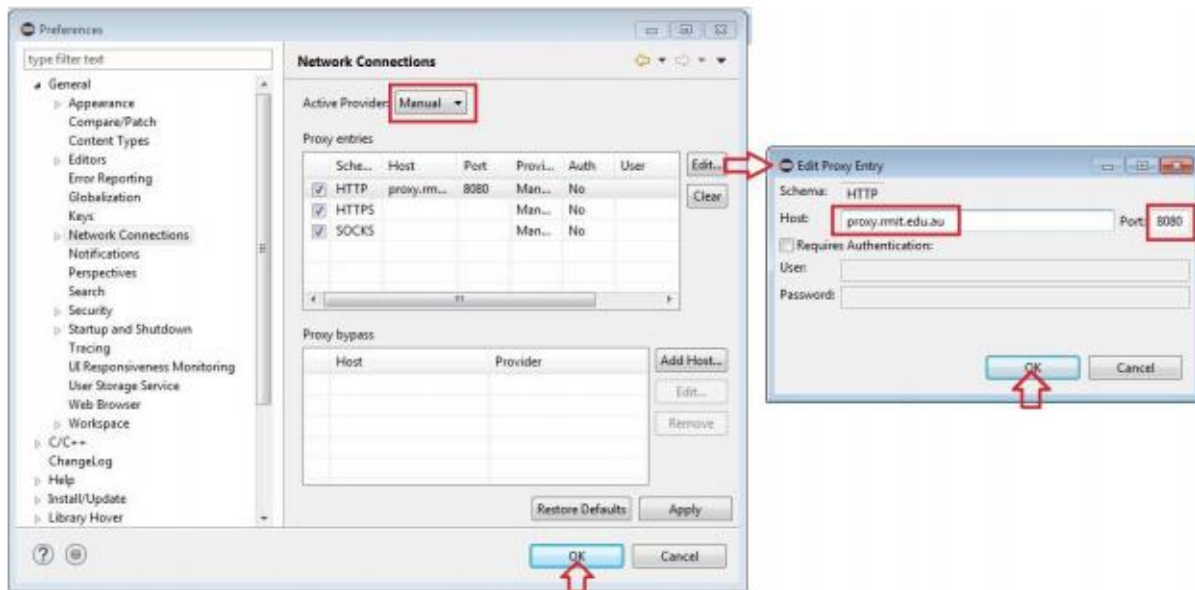

Figure 1: Eclipse Setup for Internet

**STEP 2:** Installing python environment using Eclipse Graphical Interface1.

- a. To install PyDev and PyDev Extensions using the Eclipse Update Manager, you need to use the **Help > Install New Software...** menu (note that in older versions, this would be the 'Find and Install' menu) as shown in the following figure:

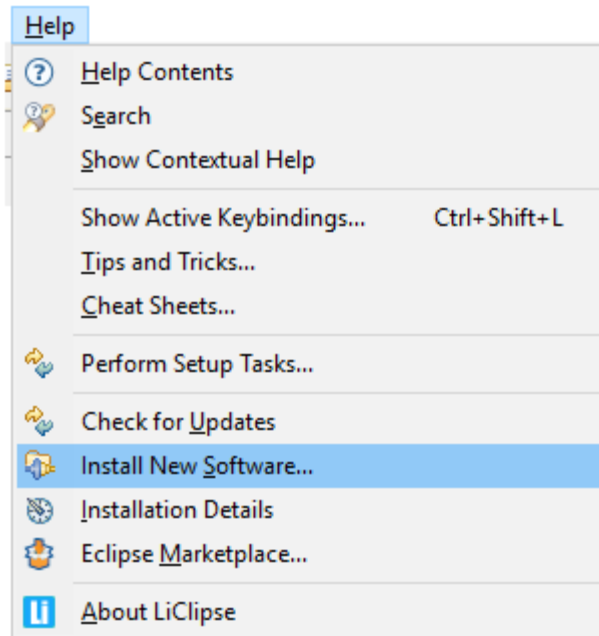

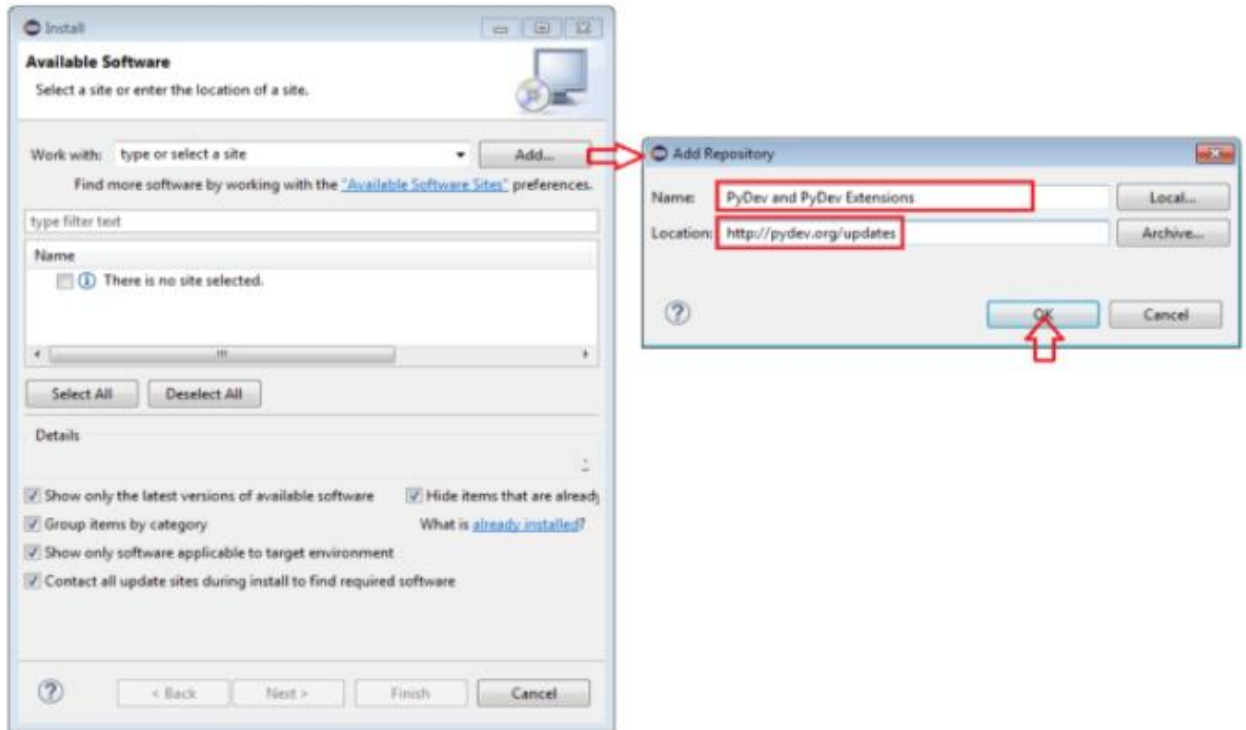

Figure 2: Setup

- b. In the next screen, add the update site(s) you want to work with (see the figure below). The available update sites are :

<http://www.pydev.org/updates>

**Figure 3: Setup Python on Eclipse**

- c. After entering the update sites, select the update site you entered or select "All available sites" and add a filter for PyDev, so that it shows the contents of all the update sites that have PyDev, then select what you want to install and click 'Next' (See the figure below):

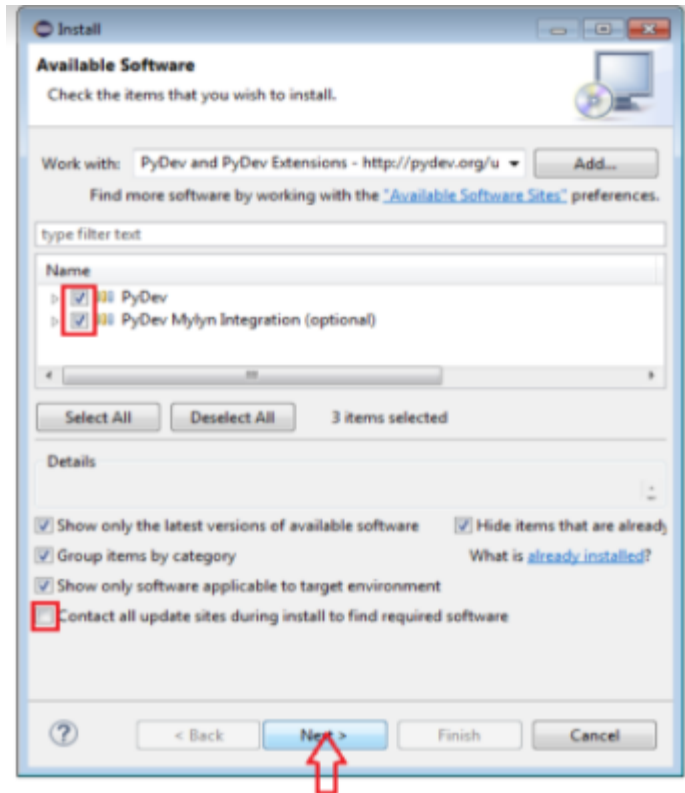

Figure 4: Setup Python on Eclipse

- d. Then, UNCHECK the 'Contact all update sites during install to find required software' and press 'NEXT' again to confirm your selection(see the figure below):

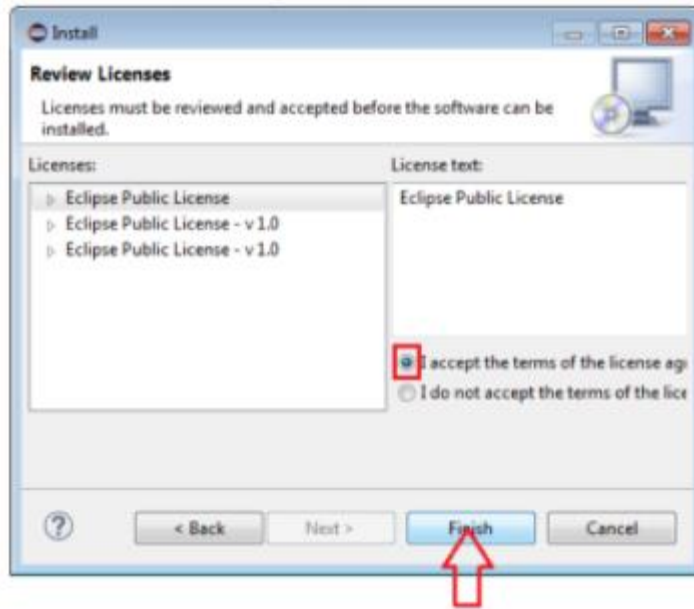

Figure 5: Setup Python on Eclipse

- e. And finally, read the license agreement if you accept, select the accept radio button and click 'Finish'(see the figure below):

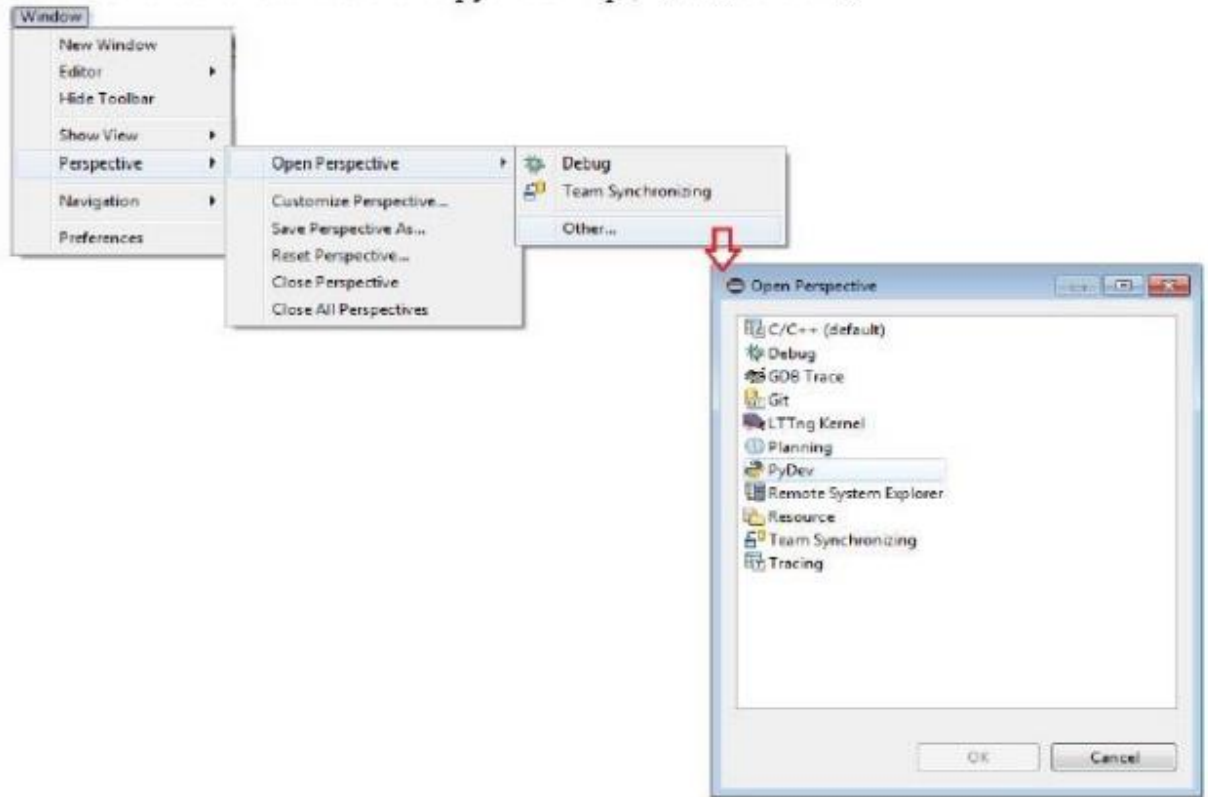

**Figure 6: Setup Python on Eclipse**

- f. At the point, Eclipse should automatically download the plugin contents and present you to a dialog asking if you want to restart (to which you should say **yes**).

**STEP 2:** Checking the installation: You can verify if it is correctly installed going to the menu 'window> preferences' and checking if there is a PyDev item under that (see Figure 7). After that eclipse will display the graphical interface for python perspective, the main components are (see Figure 8):

- ❑ Project space is the section where all your py
- ❑ Project Editor is the section where python scripts can be edited,
- ❑ Console allows the visualization of results after running a python script,

Then the project is visualized

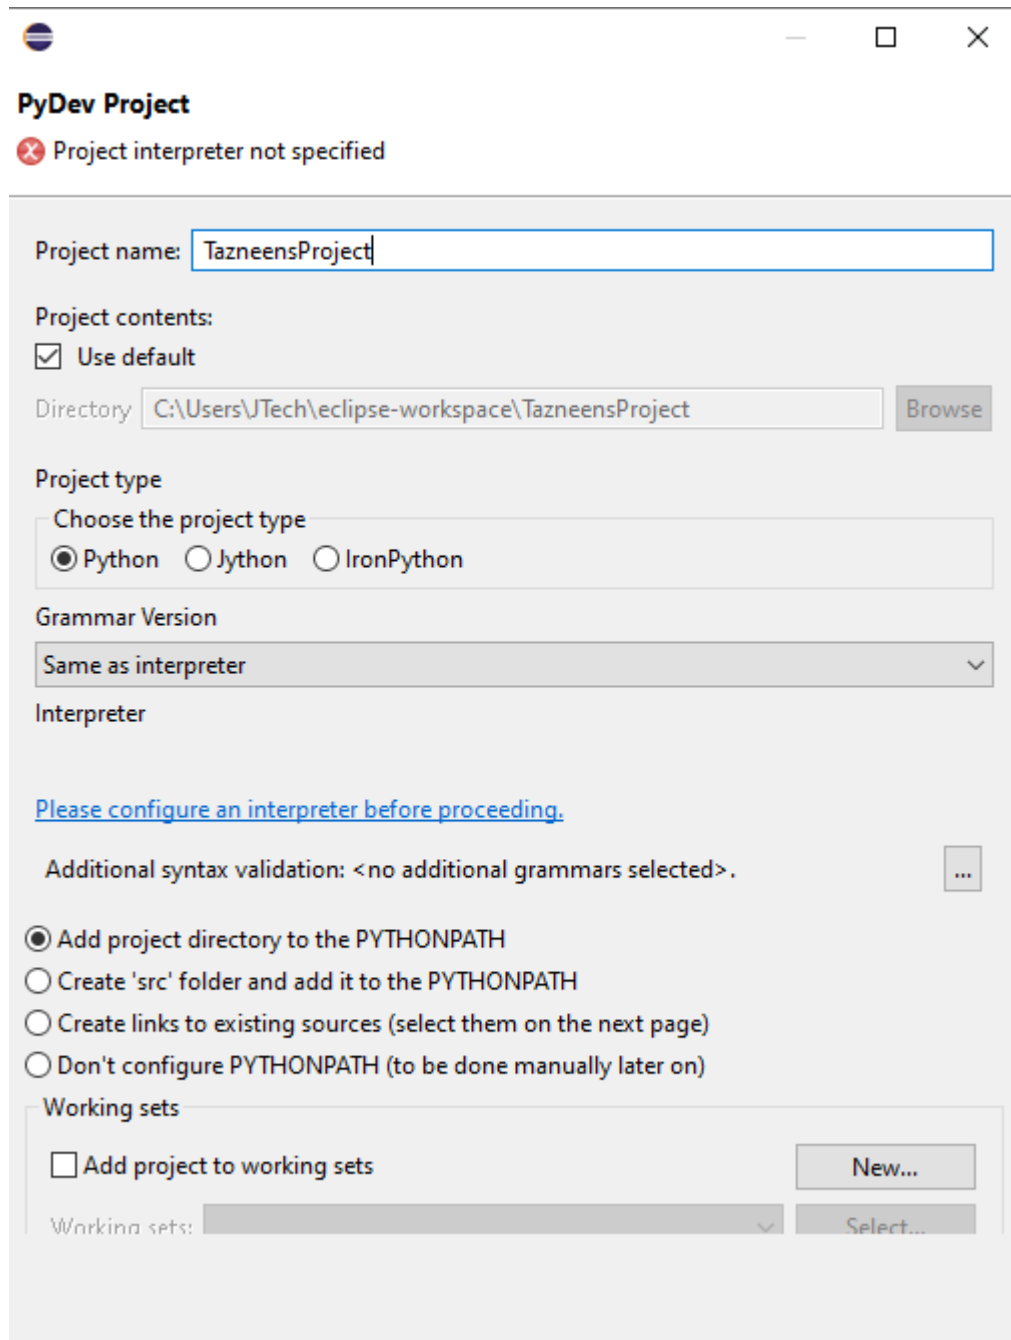

## Exercises

### Section 4.1: Basics of python and programming

#### Exercise 4.1.1: Create a python project.

Answer:

The image shows a 'PyDev Project' dialog box with a title bar containing a PyDev logo and standard window controls. A red error icon and the text 'Project interpreter not specified' are at the top. The 'Project name' field contains 'TazneensProject'. Under 'Project contents', 'Use default' is checked, and the 'Directory' field shows 'C:\Users\UTech\eclipse-workspace\TazneensProject' with a 'Browse' button. The 'Project type' section has a 'Choose the project type' label and three radio buttons: 'Python' (selected), 'Jython', and 'IronPython'. The 'Grammar Version' dropdown is set to 'Same as interpreter'. The 'Interpreter' section contains a blue link 'Please configure an interpreter before proceeding.' and a text field 'Additional syntax validation: <no additional grammars selected>' with a three-dot menu button. Below this are four radio buttons for PYTHONPATH configuration: 'Add project directory to the PYTHONPATH' (selected), 'Create \'src\' folder and add it to the PYTHONPATH', 'Create links to existing sources (select them on the next page)', and 'Don't configure PYTHONPATH (to be done manually later on)'. The 'Working sets' section has a checkbox 'Add project to working sets' (unchecked) and a 'New...' button. At the bottom, a 'Working sets:' dropdown is followed by a 'Select...' button.

**PyDev Project**

Project interpreter not specified

Project name: TazneensProject

Project contents:

☒ Use default

Directory: C:\Users\UTech\eclipse-workspace\TazneensProject Browse

Project type

Choose the project type

☒ Python ☐ Jython ☐ IronPython

Grammar Version

Same as interpreter

Interpreter

[Please configure an interpreter before proceeding.](#)

Additional syntax validation: <no additional grammars selected> ...

☒ Add project directory to the PYTHONPATH

☐ Create 'src' folder and add it to the PYTHONPATH

☐ Create links to existing sources (select them on the next page)

☐ Don't configure PYTHONPATH (to be done manually later on)

Working sets

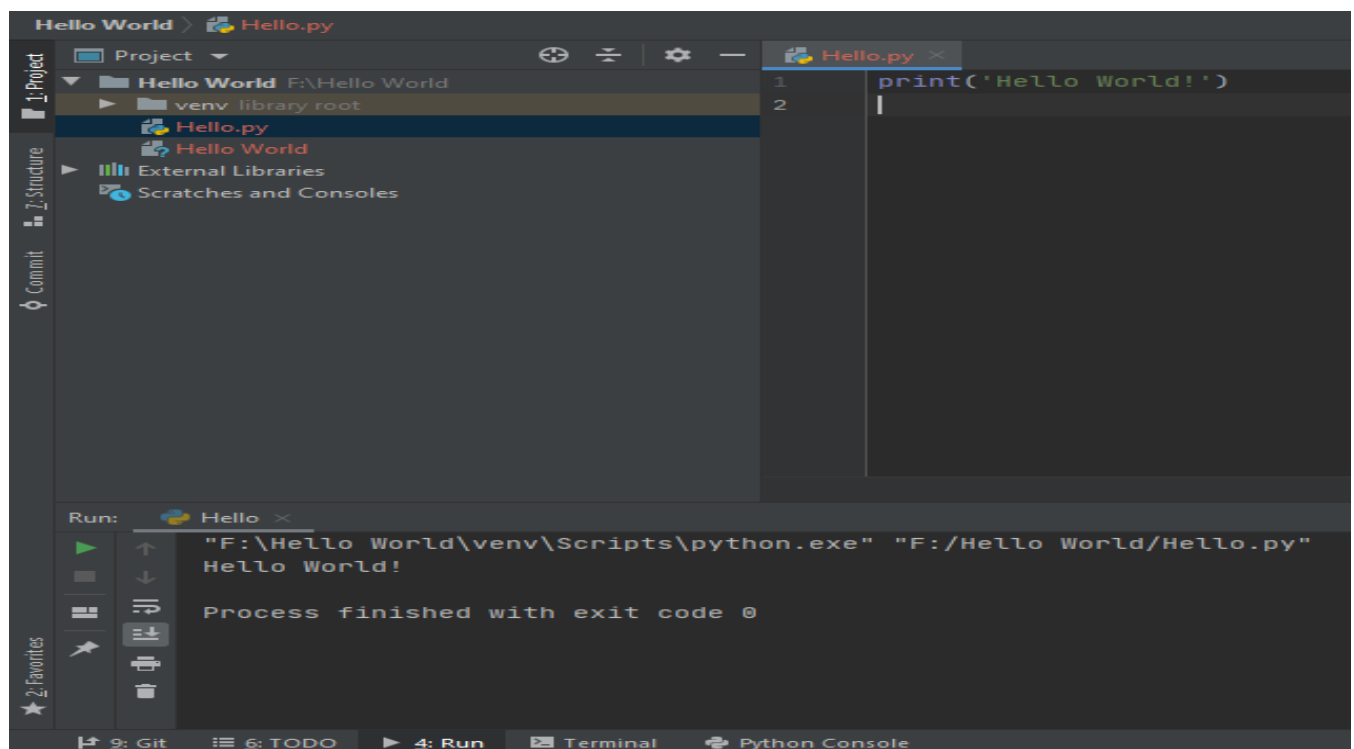

☐ Add project to working sets New...

Working sets: Select...

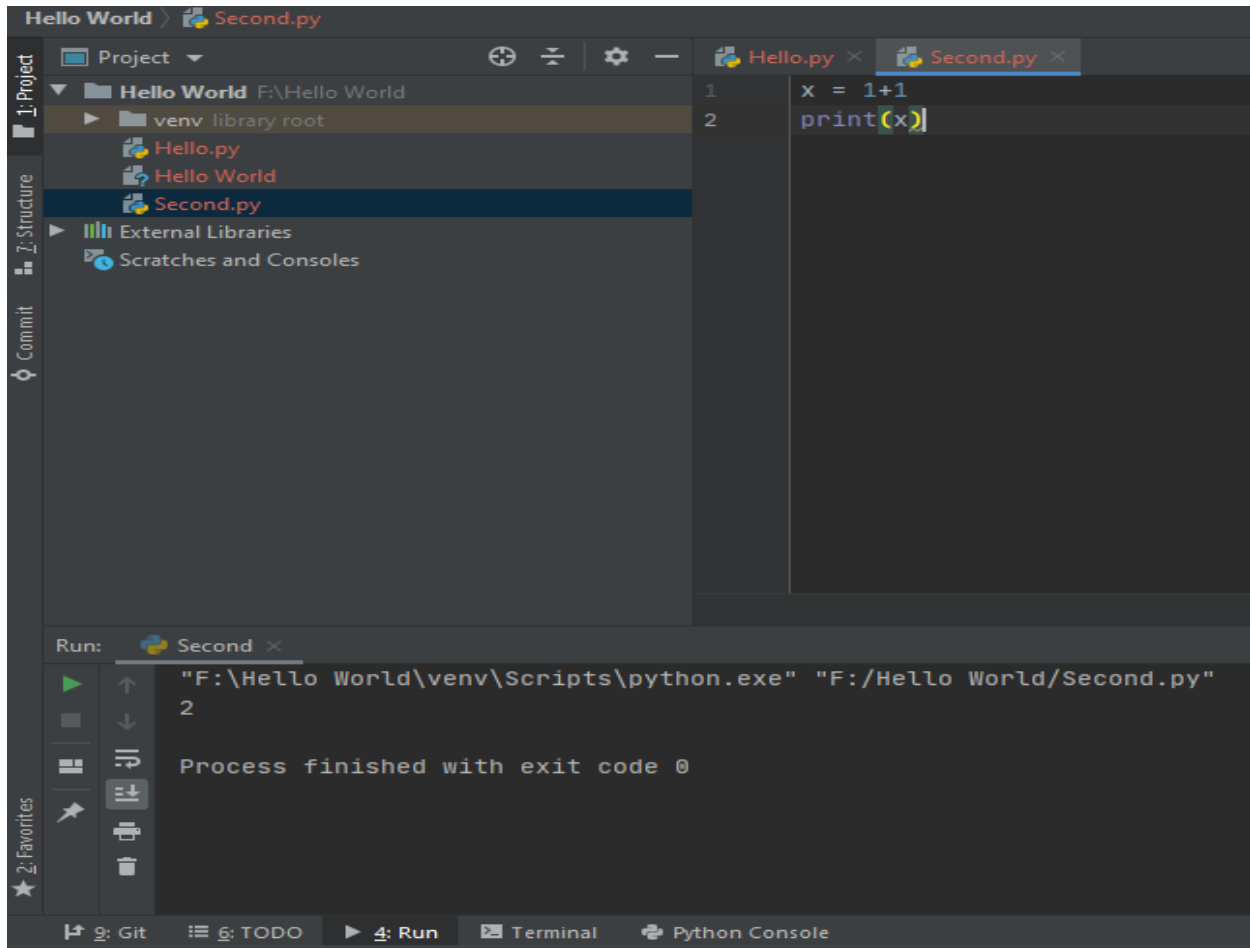

Create a python script, click in File > New > PyDev Module. Select the folder source name. Then, provide a name for the project (Hello\_world), then select empty module or main module as shown below:

**Exercise: 4.1.2 : Write a Hello World Program.**

### Exercise 4.1.3: Compute 1+1

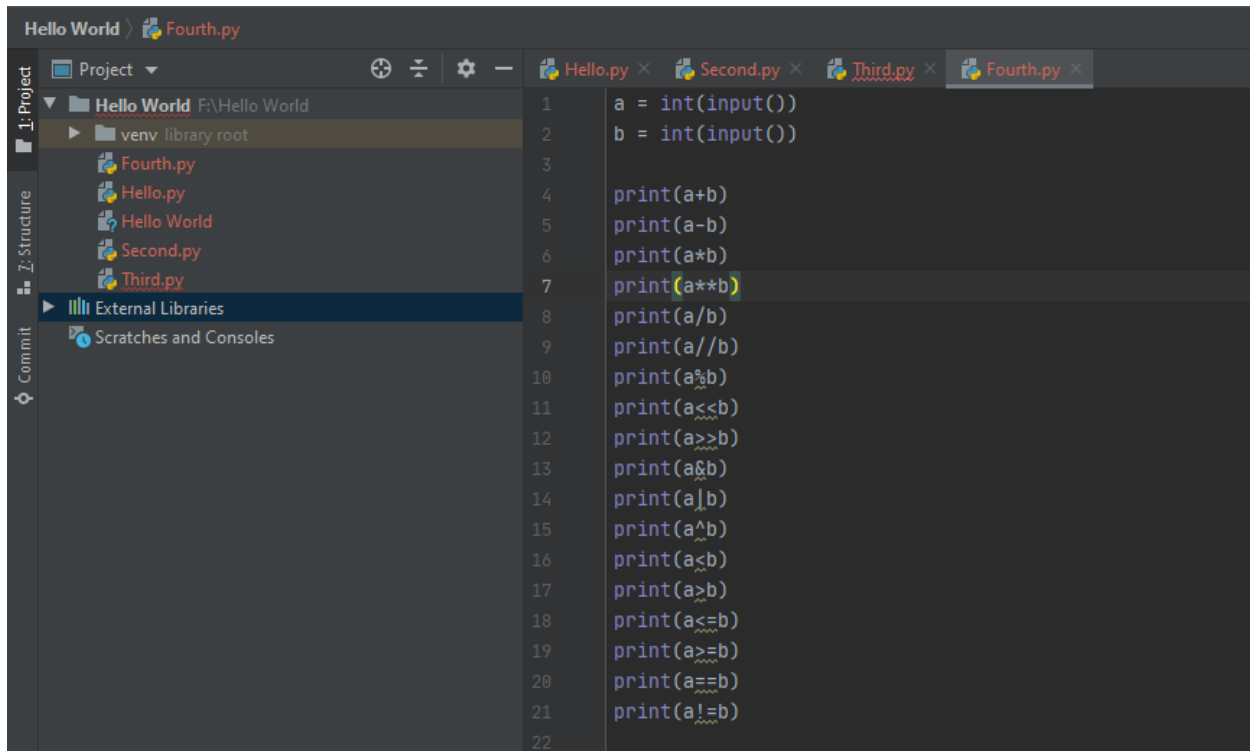

### Exercise 4.1.4: Type in program text

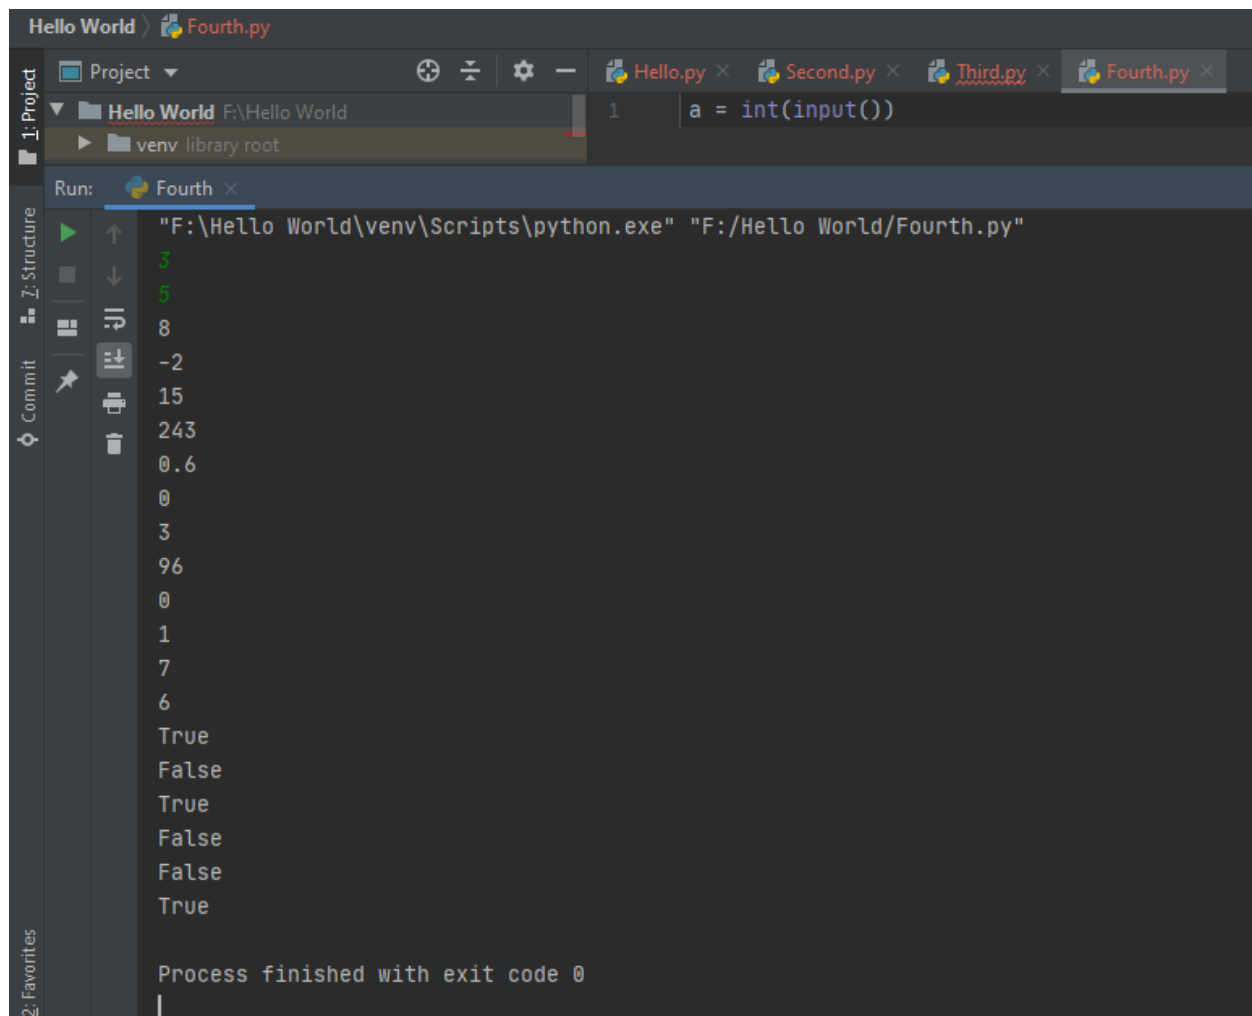

```
h = 5.0 # height
r = 1.5 # radius
pi = 3.1416
if __name__ == '__main__':
    area_parallelogram = h*r
    print('The area of the parallelogram is %.3f' % area_parallelogram)
    area_square = h**2
    print('The area of the square is %g' % area_square)
    area_circle = pi*r**2
    print('The area of the circle is %.3f' % area_circle)
    volume_cone = 1.0/3*pi*r**2*h
    print('The volume of the cone is %.3f' % volume_cone)
```

```
The area of the parallelogram is 7.500  
The area of the square is 25  
The area of the circle is 7.069  
The volume of the cone is 11.781
```

#### Section 4.1: Create and run basic example.

```
Hello World > Fourth.py  
Project  
Hello World F:\Hello World  
venv library root  
Fourth.py  
Hello.py  
Hello World  
Second.py  
Third.py  
External Libraries  
Scratches and Consoles  
Commit  
1 a = int(input())  
2 b = int(input())  
3  
4 print(a+b)  
5 print(a-b)  
6 print(a*b)  
7 print(a**b)  
8 print(a/b)  
9 print(a//b)  
10 print(a%b)  
11 print(a<=b)  
12 print(a>=b)  
13 print(a&b)  
14 print(a|b)  
15 print(a^b)  
16 print(a<b)  
17 print(a>b)  
18 print(a<=b)  
19 print(a>=b)  
20 print(a==b)  
21 print(a!=b)  
22
```

The screenshot shows an IDE window titled "Hello World" with a file named "Fourth.py" open. The code in the editor is:

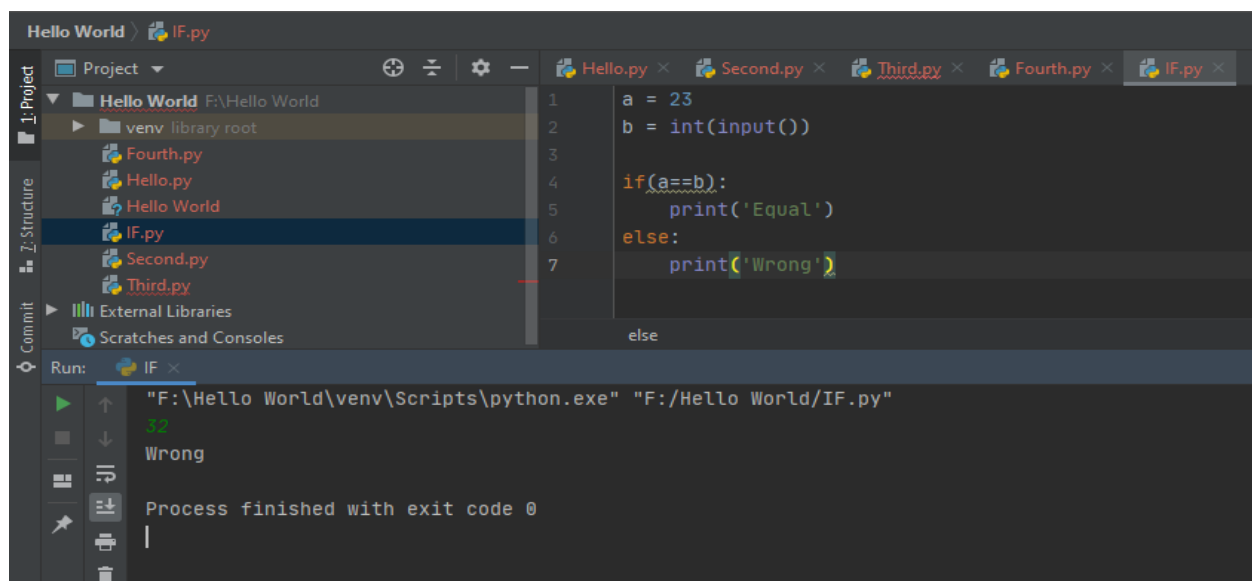

```
1 a = int(input())
```

The Run console shows the command executed: `"F:\Hello World\venv\Scripts\python.exe" "F:/Hello World/Fourth.py"`. The output of the program is:

```
3
5
8
-2
15
243
0.6
0
3
96
0
1
7
6
True
False
True
False
False
True
```

At the bottom of the console, it says "Process finished with exit code 0".

#### Exercise 4.2.2: The if statement:

The screenshot shows an IDE window titled "Hello World" with a file named "IF.py" open. The code in the editor is:

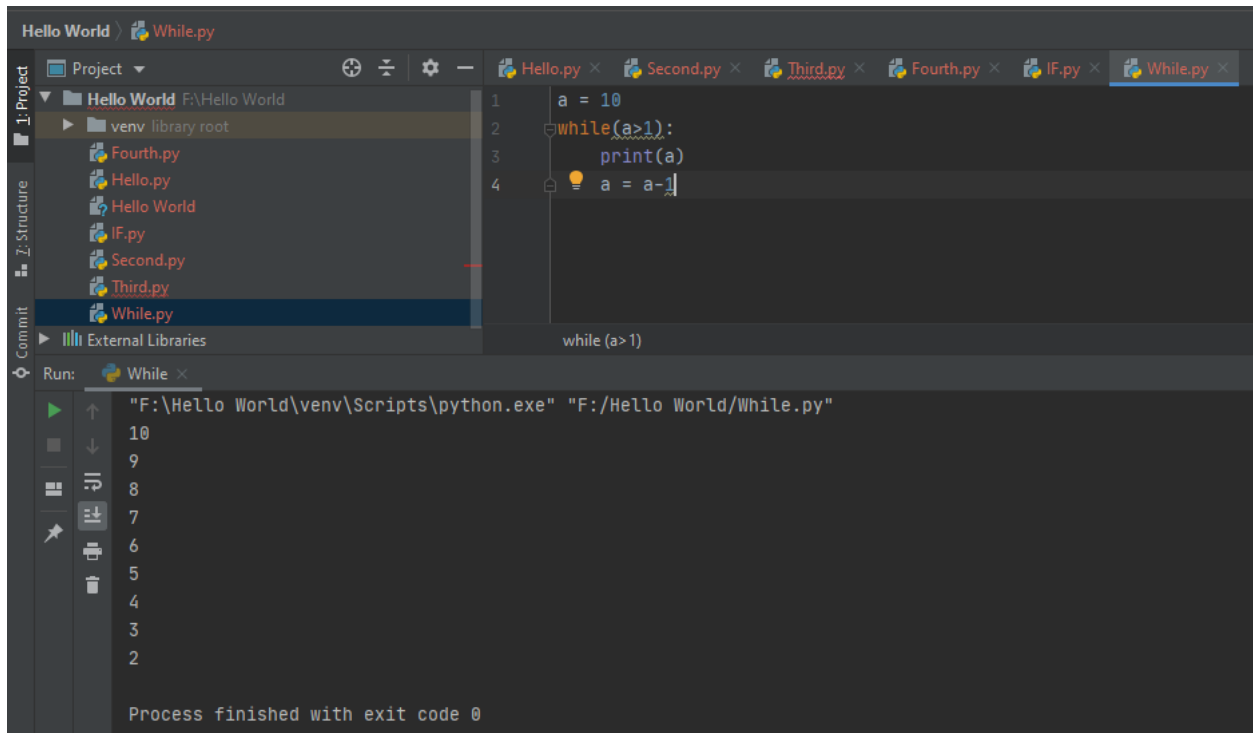

```
1 a = 23
2 b = int(input())
3
4 if(a==b):
5     print('Equal')
6 else:
7     print('Wrong')
```

The Run console shows the command executed: `"F:\Hello World\venv\Scripts\python.exe" "F:/Hello World/IF.py"`. The output of the program is:

```
32
Wrong
```

At the bottom of the console, it says "Process finished with exit code 0".

### Exercise 4.2.3: The while Statement

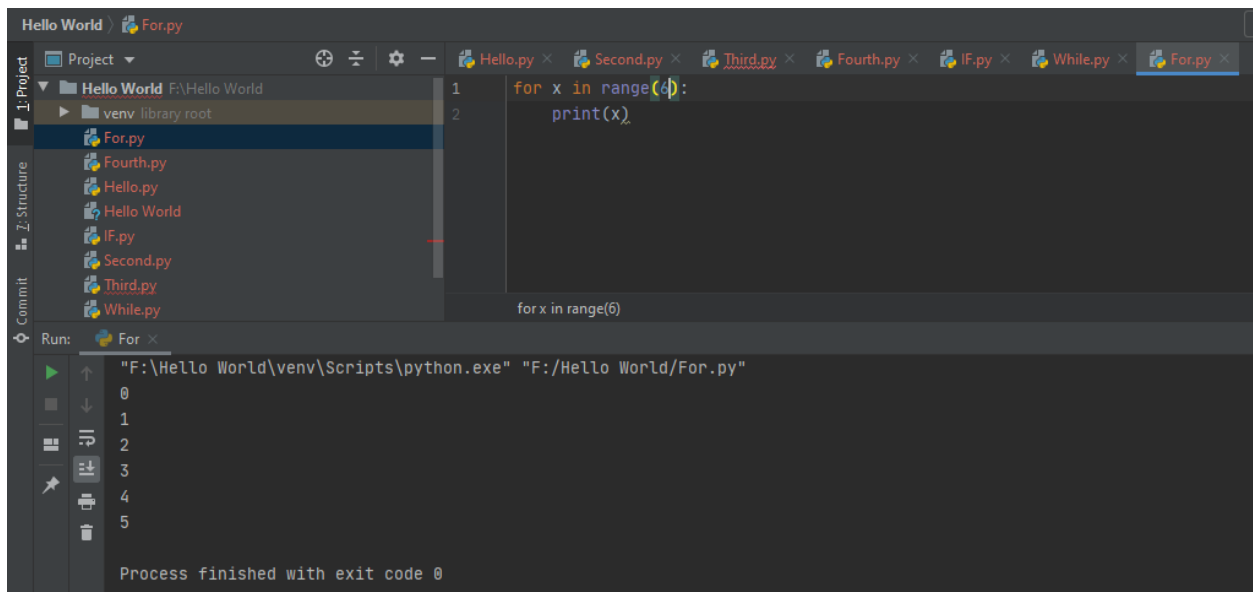

The screenshot shows an IDE with a project named "Hello World". The file explorer on the left lists several Python files: `Fourth.py`, `Hello.py`, `Hello World`, `IF.py`, `Second.py`, `Third.py`, and `While.py`. The `While.py` file is open in the editor, showing the following code:

```
1 a = 10
2 while(a>1):
3     print(a)
4     a = a-1
```

The output window at the bottom shows the execution of the program, displaying the numbers 10 through 2 in descending order. The command executed was `"F:\Hello World\venv\Scripts\python.exe" "F:/Hello World/While.py"`, and the process finished with exit code 0.

### Exercise 4.2.4: The for Statement

The screenshot shows the same IDE with the `For.py` file open. The code in the editor is:

```
1 for x in range(6):
2     print(x)
```

The output window shows the execution of the program, displaying the numbers 0 through 5 in ascending order. The command executed was `"F:\Hello World\venv\Scripts\python.exe" "F:/Hello World/For.py"`, and the process finished with exit code 0.

**Conclusion:** Python is a language that is remarkably easy to learn, and it can be used as a stepping stone into other programming languages and frameworks. If you're an absolute beginner and this is your first time working with any type of coding language, that's something you definitely want.

Python is widely used, including by a number of big companies like Google, Pinterest, Instagram, Disney, Yahoo!, Nokia, IBM, and many others. The Raspberry Pi – which is a mini computer and DIY lover's dream – relies on Python as it's main programming language too. You're probably wondering why either of these things matter, and that's because once you learn Python, you'll never have a shortage of ways to utilize the skill. Not to mention, since a lot of big companies rely on the language, you can make good money as a Python developer.

- 1) Python can be used to develop prototypes, and quickly because it is so easy to work with and read.
- 2) Most automation, data mining, and big data platforms rely on Python. This is because it is the ideal language to work with for general purpose tasks.
- 3) Python allows for a more productive coding environment than massive languages like C# and Java. Experienced coders tend to stay more organized and productive when working with Python, as well.
- 4) Python is easy to read, even if you're not a skilled programmer. Anyone can begin working with the language, all it takes is a bit of patience and a lot of practice. Plus, this makes it an ideal candidate for use among multi-programmer and large development teams.
- 5) Python powers Django, a complete and open source web application framework. Frameworks – like Ruby on Rails – can be used to simplify the development process.
- 6) It has a massive support base thanks to the fact that it is open source and community developed. Millions of like-minded developers work with the language on a daily basis and continue to improve core functionality. The latest version of Python continues to receive enhancements and updates as time progresses. This is a great way to network with other developers.
